DETAILED ACTION

Election/Restrictions

Applicant's election of claims 1-13 in the reply filed on 09/07/06 is acknowledged. This application is in condition for allowance except for the presence of claims 14-17 directed to species 2-7 non-elected. Accordingly, claims 14-17 are cancelled with the applicant's consent established in the telephone interview conducted on 12/05/06.

EXAMINER'S AMENDMENT

The application has been amended as follows:

Claim 1 [Currently Amended] An electronic control unit comprising: a connector having a lateral surface, a longitudinal surface opposite to the first lateral surface, and a pair of first inclined portions connecting the lateral surface and longitudinal surface, at least one of said first inclined portions being inclined with respect to the first lateral surface at a first angle; a case having a peripheral side portion formed with a concave groove in which the connector is fitted with a clearance portion there between, said concave groove comprising a base surface opposite to the lateral surface of the connector; and a pair of second inclined portions opposite to the first inclined portions, respectively, at least one of said second inclined portions opposite to the at least one of said first inclined portions being inclined with respect to the base surface at a second angle, said second angle being larger than the first angle; and a seal member disposed in the clearance portion between the connector and the concave groove of the case, said seal member sealing the clearance portion there between.

Claim 2 [Currently Amended] An electronic control unit according to claim 1, wherein each of said first inclined portions is inclined outwardly with respect to the first lateral surface at the first angle, and each of said second inclined portions is inclined outwardly with respect to the base surface.

Allowable Subject Matter

Claims 1-13 are allowed.

The following is an examiner's statement of reasons for allowance: With regards to independent claims 1 and 11 Kobayashi (US Patent 6407925) teaches an electronic control unit comprising a connector having a lateral surface, a longitudinal surface opposite to the lateral surface, and a pair of first inclined portions connecting the lateral surface and longitudinal surface, at least one of said first inclined portions being inclined with respect to the lateral surface at a first angle, a case having peripheral side portion with a concave groove in which the connector is fitted with a clearance portion there between, said concave groove comprising a base surface opposite to the lateral surface of the connector and a pair of second inclined portions opposite to the first inclined portions, also a seal member disposed in the clearance portion between the connector and the concave groove of the case. Kobayashi does not teach that said second inclined portions are inclined with respect to the base surface at a second angle said second ^{angle} ~~angle~~ being larger than the first angle. Furthermore there is no evidence in the prior art making this modification obvious.
